what are the basic building blocks of the world this book presents a naturalistic theory saying that the universe and everything in it can be reduced to three fundamental entities a field a set of values that can be actualized at different places in the field and an actualizer of the values the theory is defended by using it to answer the main questions in metaphysics such as what is causality existence laws of nature consciousness thinking free will time mathematical entities ethical values etc the theory is compared with the main alternatives and argued to solve problems better than the existing theories several new theories are suggested such as how to understand mental causation free will and the truth of ethics and mathematics

this invaluable monograph is devoted to a rapidly developing area on the research of qualitative theory of fractional ordinary and partial differential equations it provides the readers the necessary background material required to go further into the subject and explore the rich research literature the tools used include many classical and modern nonlinear analysis methods such as fixed point theory measure of noncompactness method topological degree method the technique of picard operators critical point theory and semigroup theory based on the research work carried out by the authors and other experts during the past seven years the contents are very recent and comprehensive in this edition two new topics have been added that is fractional impulsive differential equations and fractional partial differential equations including fractional navier stokes equations and fractional diffusion equations

the material in this volume provides the basic theory necessary to understand the principles behind imaging the subsurface of the earth using reflection and refraction seismology for reflection seismology the end product is a record section from a collection of wiggly traces that are recorded in the field from which information about the properties of subsurface structure and rock can be derived for the most part the principles of imaging are the same regardless of the depth to the target the same mathematical background is necessary for targeting a shallow water table as for investigating the base of the earth's continental crust at a depth of 30 50 km

this festschrift volume published in honour of peter buneman contains contributions written by some of his colleagues former students and friends in celebration of his distinguished career a colloquium was held in edinburgh scotland 27 29 october 2013 the articles presented herein belong to some of the many areas of peter's research interests

semiconductor optoelectronic devices are at the heart of all information generation and processing systems and are likely to be essential components of future optical computers with more emphasis on optoelectronics and photonics in graduate programmes in physics and engineering there is a need for a text providing a basic understanding of the important physical phenomena involved such a training is necessary for the design optimization and search for new materials devices and application areas this book provides a simple quantum mechanical theory of important optical processes i.e. band to band intersubband and excitonic absorption and recombination in bulk quantum wells wires dots superlattices and strained layers including electro optic effects the classical theory of absorption quantization of radiation and band picture based on $k \cdot p$ perturbation has been included to provide the necessary background prerequisites for the book are a knowledge of quantum mechanics and solid state theory problems have been set at the end of each chapter some of which may guide the reader to study processes not covered in the book the application areas of the phenomena are also indicated
